

What About High Blood Pressure Among Black People?

The rate of high blood pressure among Black people in the United States is one of the highest in the world. About 55% of Black people in the U.S. have high blood pressure. It is often more severe in Black people than in other ethnic groups.

Several factors play a role in these numbers. The factors may include a lack of access to health care, medications and healthy foods, among other issues. There has also been a distrust of the health care community based on previous discrimination.

The good news is high blood pressure can be managed. Commit to start making better choices today.

What should my blood pressure be?

Normal blood pressure is below 120/80 mm Hg. The upper number is the systolic pressure. It's the pressure in your arteries when the heart beats. The lower number is diastolic pressure. This is the pressure when the heart rests between beats. If you're an adult with a systolic blood pressure of 120 to 129, and your diastolic pressure is less than 80, you have elevated blood pressure. High blood pressure is a systolic pressure of 130 or higher or a diastolic pressure of 80 or higher that stays high over time.

How often should I check my blood pressure?

For proper diagnosis of high blood pressure, your health care professional will use an average based on two or more readings obtained on two or more days.

You can have your blood pressure checked at a doctor's office, hospital, clinic, nurse's office, pharmacy, company clinic or health fair. You can also buy a home blood pressure monitor so you can check it at home. Your health care professional will tell you how often you should have it checked.

How can high blood pressure affect me?

Left uncontrolled or undetected, high blood pressure can damage blood vessels in various parts of your body. The longer it's left untreated, the more likely organs such as your heart, brain, kidneys or eyes will be damaged. This can lead to heart attack, stroke, heart failure, kidney disease, erectile dysfunction and loss of vision.

What can I do about my blood pressure?

Making healthy lifestyle changes is the first step.

- Don't smoke. Avoid secondhand smoke.
- Reach and maintain a healthy weight.
- Eat a healthy diet that is low in saturated and trans fats and rich in fruits, vegetables, whole grains and low-fat dairy products.
- Eat less red meat and more fish and poultry. Avoid fried foods.
- Try to consume less than 1,500 milligrams (mg) per day of sodium (salt). Even reducing your daily intake by 1000 mg can help.

(continued)

What About High Blood Pressure Among Black People?

- Eat high-potassium foods, such as bananas, beet greens, lima beans and sweet potatoes. Aim for 3,500 – 5,000 mg of dietary potassium per day.
- Limit alcohol to no more than one drink per day for women or two drinks a day for men.
- Be more physically active. Get at least 150 minutes of moderate-intensity aerobic physical activity per week.

What about medications?

You may need one or more types of medication in addition to lifestyle changes to reach your blood pressure goal.

Some medications may be less effective in treating Black people with high blood pressure. Thiazide-type diuretics (water pills) and/or calcium channel blockers are more effective in lowering blood pressure in Black people when given alone or as initial medications in a multidrug treatment plan. You may need a trial period before your health care professional finds the best one, or combination of medications, for you.

If you are prescribed medication, always take it as prescribed. Don't stop taking it unless your health care professional tells you to.

Where can I find support?

You need access to social support and affordable, quality medical care and medications to help manage blood pressure.

If you have concerns about accessing care, affording your medications or finding transportation to and from medical appointments, ask your health care team or a trusted community leader for support. They may know of local resources to assist you.

HOW CAN I LEARN MORE?

- 1 Call 1-800-AHA-USA1 (1-800-242-8721) or visit [heart.org](https://www.heart.org) to learn more about heart disease and stroke.
- 2 Sign up for our monthly *Heart Insight* e-news for heart patients and their families at [HeartInsight.org](https://www.heartinsight.org).
- 3 Connect with others sharing similar journeys with heart disease and stroke by joining our Support Network at [heart.org/SupportNetwork](https://www.heart.org/SupportNetwork).

Do you have questions for your doctor or nurse?

Take a few minutes to write down questions for the next time you see your health care professional.

For example:

How is high blood pressure treated?

What type of diet will help?
